<u>Task1</u>

"Define CSS and explain its role in web development. Create a simple HTML document and include a basic CSS stylesheet that changes the background color, text color, and font size of the page. Explain each part of the CSS code and its effect on the HTML elements."

➔ CSS Definition and Role in Web Development: CSS (Cascading Style Sheets) is a language used to describe the presentation of a web page written in HTML. It defines how HTML elements are displayed, including layout, colors, fonts, and spacing. CSS separates content (HTML) from design (CSS), allowing developers to manage styling independently.

➔ CSS Code:
  o background-color: Sets the background color of the page.
  o color: Defines the text color on the page.
  o font-size: Adjusts the size of the text on the page.
